1. Running SRTS

1.1 Introduction

SRTS is an empirical bioeconomic model of timber supply based on detailed Forest Inventory and Analysis (FIA) data¹. From these data we are able extract forest inventory, removals and biological factors for custom sub-regions that are important to a model client. The flexibility of regional scope makes SRTS applicable to analyzing a variety of problems: from broader policy and sustainability questions to analysis of a small timber basin. The maximum regional extent of the model is the Southern U.S. Region (see the figure below). Appendix A in this document lists the counties that fall within each sub-region. As a model of timber supply in stumpage markets only, it is up to the user to specify demand projections. Procedures to ensure the correct starting point for a demand projection are discussed below. For a detailed review of how the model works, see Abt et al., 2009 (available in the SRTS Documentation folder).

¹ provided by the USDA Forest Service: https://www.fs.usda.gov/research/products/dataandtools/datasets/fiadatamart

1.2 Installation

SRTS is a standalone executable written in the Visual Basic programming language. As such, it does not require installation with an installer package. However, some steps need to be taken to ensure proper functionality on 64-bit operating systems. SRTS is compatible with computers running a Windows operating system. Computers running other operating systems have shown mixed compatibility, and support is not guaranteed for those systems.

To apply the fix for 64-bit machines, take the following steps:

- 1. Navigate to the Documentation > 64-bit Installation folder.
- 2. Copy the "MSSTDFMT.DLL" file to the directory: C:\WindowsnSysWOW64\

3. Open cmd.exe as administrator (right-click, Run as administrator)

- 4. Change directories to WindowsnSysWOW64 folder and register the DLL:
 - Type "cd .." and hit Enter.
 - Type "cd SysWOW64" and hit Enter.
 - Type "regsvr32 msstdfmt.dll", hit Enter.

```
Administrator: C:\Windows\System32\cmd.exe

Microsoft Windows [Version 6.1.7601]

Copyright (c) 2009 Microsoft Corporation. Al

C:\Windows\system32>cd ..

C:\Windows>cd SysWOW64

C:\Windows\SysWOW64>regsur32 msstdfmt.dll_
```

1.3 Running the Model - A Brief Tutorial

The SRTS Distribution comes pre-configured to run a southwide and state-level analyses. To make your first SRTS run, follow these steps.

- 1. If you have not already read the preceding Installation section, do so now to ensure compatibility of SRTS with your computer.
- 2. Double-click the SRTS executable in the main SRTS directory: "srts_mmddyy.exe". The user interface shown below should appear.

- 3. Click 'Run' and the model should successfully make a run based on a DAT file with the name highlighted in yellow above (i.e. "South35b.DAT"). Note: A 'Not Responding' message in the user interface is nothing to be concerned about.
- 4. After the model run is complete, the word 'END' will appear on the user interface. Several output files will also appear in the same folder as the SRTS executable.
- 5. To close SRTS, you must click the 'Quit' button.

After completing the preceding steps, you have technically completed a SRTS run. The remainder of the process is understanding the purpose of the assorted output files.

The remaining documentation discusses the purpose and format of each input and output file. To complete the basic tutorial, however, the following outlines the basic order of preparation for running the model.

- 1. Identify a region of interest and submit a basin request.
 - a. Arrange a comma-delimited 'basin request' file as described in Chapter 2, section 2. Submit this .csv file by email to the SOFAC Research Associate to obtain an inventory file with differentiated ownership (corporate and non-corporate).
 - b. The basin request must include a minimum of 5 to 8 counties per sub-region for compliance with an MOU.
 - c. Optionally request a History (.Hist) file showing historical merchantable volume.
 - d. Alternatively create your own inventory file for 'One-owner mode' runs using the "INVmaker.exe" program located in the Data folder.

2. Set up your .DAT file

- a. Following an included DAT file template and consulting the section describing the .DAT file, create the DAT file for your run.
- b. Use 'MPCONST.PRJ' for your demand projection in this initial construction.
- c. Insure that other input files listed in the .DAT file are located in the Data folder.
- d. Alternatively use the SRTSassistant.exe to create .DAT files and .PRD files.

3. Make a run with your .DAT file

- a. After the run is complete, locate "MPCONST.PRJ" in the Data folder, and open it to edit the file in Excel.
- b. Leave year 0 removals by product unchanged.
- c. Change consecutive years to match your anticipated demand projection.
- d. Save your custom .PRJ file in the Data Folder

4. Prepare other input files

- a. Revise your .DAT file by renaming the .PRJ file to match your custom .PRJ file saved in the last step.
- b. Create additional input files as required for selected model options if necessary.

5. Make your final run

- a. Run SRTS with your new .DAT file
- b. Examine the output files of interest. The main output file is the .GPG file.

1.4 File Structure

The basic SRTS file structure is organized in the following manner:

SRTSv35c (folder)

- 1. Data (subfolder)
 - a. INVmaker ("SRTS INVmaker 062520.exe")
 - b. Assorted required files (e.g. TPO history files and "MPCONST.PRJ")
 - c. .PRD file
 - d. .INV file
 - e. .PRJ file
 - f. .DBH file
 - g. TPO adjustment coefficients: "su_cty_tpoNewLU_2017_tpoadj.csv"
- 2. Documentation (subfolder)
 - a. 64-bit Installation (subfolder)
 - b. This user guide.
 - c. Other key reference files ("Measurement dates v35c.xlsx", "PriceElasticities.xlsx", "BatchRunTemplate.xlsx")
- 3. Figures (subfolder)
- 4. lib (subfolder)
 - a. Assorted required files
 - b. Default files needed for SRTS Assistant ("elast.default", "param.default", "prods.default", "strng.default")
 - c. Land-Use Change coefficients file ("LUBetaClean.csv")
 - d. Pine Map Growth Carbon Fertilization option coefficients file ("PMap_Grwth3.csv")
- 5. Preprocessing (subfolder)
 - a. .DC generation script file ("GPGtoDCshare.R")
 - b. SRTS Assistant (R version)
 - i. "batchsrts.txt"
 - ii. "SRTSAssistant.xlsx"
 - iii. SRTSAssistantv3.R"
 - iv. SUtoSRTSReg.csv"
 - v. "Readme.docx"
- 6. Postprocessing (subfolder)
 - a. Post-run script file for visualizing results ("PostprocessingScript.R")
 - b. Link between county FIPS and Survey-Unit ID numbers ("AddFIAunitIDs.R")
- 7. Runs (a subfolder for storing previous runs)
 - a. Run 1
 - i. Input Files (folder for storing input files for a run)
 - ii. Output Files (folder for storing output files from a run)
 - iii. Results (folder for storing charts and maps of model results)

- b. Run 2
 - i. Input Files (folder for storing input files for a run)
 - ii. Output Files (folder for storing output files from a run)
 - iii. Results (folder for storing charts and maps of model results)
- c. Etc...
- 8. SRTS program file ("srts mmddyyyy.exe")
- 9. CarbonWelfare2020 program file ("CarbonWelfare2020.exe")
- 10. SRTS Assistant v.06.11.2020 ("SRTSassistant.exe")
- 11. .DAT file(s)
- 12. Faustmann coefficients file (.FAUST file)
- 13. Direct Change file (.DC)
- 14. Partial Harvest file (.PH)
- 15. Starting prices by product type ("WelfareStrtPrc.csv")
- 16. All Output files generated from most recent SRTS run. These can be moved to the "Runs" subfolder for later reference after making a SRTS run.

1.5 Input Files and Model Options

Input files needed to run the model are typically space or comma delimited text files with custom file extensions (e.g. .DAT, .PRD, .INV). To view or edit input files, it is useful to download and install a text editor program like Notepad++ or Wordpad. Right-click the input file and *Open With...* your chosen text editor program. In the sections that follow, you may copy example input files to use as templates for your own input files. Alternatively, you may use SRTSassistant to create .DAT and .PRD files. Inventory (.INV) files are not created manually by the user.

1.5.1 Main Configuration File - *.DAT

This section of the document gives a line-by-line description of the .DAT file and a general description of associated input files. The .DAT file is the run configuration file. This is the file that identifies the parameters and input files for the run. The name of this file is the only input required on the SRTS user interface. The user interface simply concatenates the three .DAT Filename textboxes and looks for the .DAT file extension in the folder where the SRTS application is located. For example, the screen below instructs SRTS to read the configuration file "AL.DAT". This name is not case sensitive. All of the information required for a basic run is in this file. The user hits the RUN button and at the end of the run either quits or enters a new .DAT file name.

```
AL
"standard5.PRD" "MPCONST.PRJ" "v34a_lin_dbh_gs.csv" "ALStack_34a_gs.inv" "AL"
6 5 2016 44 1
1 "AL-SW_S" 2 "AL-SW_N" 3 "AL-SE" 4 "AL-WCtrl" 5 "AL-NCtrl" 6 "AL-North"
0.3 0.3 0.3 0.3 0.3
0.3 0.4 0.5 0.3 0.5
1.0 1.0 1.0 0.7 0.7
0.3 0.4 0.5 0.5 0.5
```

Saving the .DAT file from a run gives a summary of all of the input filenames, output filenames, regions, and elasticities. After the run a YourRunID.INI file is created that shows all of the menu settings from that run. The "YourOutputFilename.DSC" output file described in the "Output Files" section (below) gives a full description of the run.

By default, SRTS starts with the .DAT file and settings from the last run made. If you put in a .DAT filename from a previous run and then push the "Load Previous Settings" button, the previous settings associated with that .DAT file run are loaded. Note that this requires that the previous run was done with SRTS 3.9 or later, which creates an ".INI" file for every run. You can then enter a new DAT filename and retain the settings from the previous run.

DAT File Contents

The .DAT file is read in list format, so line numbers aren't important as long as the data is in the expected order. Still, organizing a DAT file by lines is useful for troubleshooting and explaining the sections. The following descriptions reference the line numbers in the preceding example .DAT file. Note that the line numbers are not actually part of the file contents.

Run Description (Line 1):

ALABAMA - PINE MARKET

This is an optional line to describe the run. If the program sees ".PRJ" and ".PRD" on this line, it assumes you don't have a Run Description line. The Run Description line is also used for the advanced OptionFile procedure, discussed in a later section.

File Names (Line 2):

"standard5.PRD" "MPCONST.PRJ" "v34a 1in dbh gs.csv" "ALStack_34a_gs.inv" "AL"

This line name four files that must be located in your "/Data/" folder, followed by an output filename of your choice - a total of five terms. When this example .DAT file is run by SRTS, the four files must be present to avoid errors. Typos are a common mistake related to this line. When SRTS runs successfully, the output files are produced in the same folder as the .DAT file, and they will all be named according to your chosen output file name. Acronyms for the file types are explained below, and a full description of the file contents are described in later sections.

- 1. .PRD Product Definition File
- 2. .PRJ Harvest Projection File
- 3. .csv Diameter Distribution File (diameter at breast height)
 - a. For Growing Stock volume with 1" delineation use "v35c 1in dbh gs.csv"
 - b. For All Live volume with 1" delineation use "v35c 1in dbh al.csv"
- 4. .INV Summarized FIA Inventory Data (can be a .csv file)
- 5. OUTPUT Filename to be used for output files

Run Parameters (Line 3):

6 5 2016 44 1

These are parameters for the run. Certain parameters must be consistent with the files listed on line 2 or internally consistent with the DAT file. Check these consistencies to troubleshoot, especially if you get "subscript out of range" errors. Here is a description of each parameters meaning along with places to check for consistency:

Parameter	Meaning	Check for Consistency
6	Number of Regions	SRTS Region Numbers & Labels
5	Number of Products	.PRD file
2016	Starting Year	Avg. re-measurement date for .INV file
44	Number of years to project	.PRJ file row index
1	Interval (years) between detailed report	None

SRTS Region Numbers and Region Labels (Line 4):

1 "AL-SW S" 2 "AL-SW N" 3 "AL-SE" 4 "AL-WCtrl" 5 "AL-NCtrl" 6 "AL-North"

This section follows a format with a SRTS Region Number followed by a Region Label in quotes. The SRTS Region Numbers are specific to these survey units. They are keyed to the "stateunitphyky.txt" file located in the lib subfolder, which allows the program to match DBH distributions to sections (Southeast or South Central) and physiographic regions. Refer to the Southwide input file or the "SRTS REGION LOOKUP.xls" worksheet to select the appropriate SRTS number for any subregion. Alternatively, you can use the SRTSassistant executable to automatically determine the SRTS Region Number that is a custom basin, based on the survey unit that most of the counties fall in.

If you were running just one basin in SE Georgia, for example, you would use SRTS Region Number 16 to key the program to the right diameter distribution. These numbers do not have to be unique; all of the basins in a run could use the same number. Region Labels are used in the output reports. The order of these regions in the .DAT file must match the order of the data in the .INV data file.

Elasticities

Following the regions and labels listing, we list elasticities by product. The number of elasticity measures in each category described below must match the number of products specified on Line 2, and product order must match the product definition file. If the run uses one-owner mode, Lines 19 and 20 should be omitted from the DAT file.

Demand Price Elasticities by Product (Line 5):

```
0.3 0.3 0.3 0.3 0.3
```

The percent change in quantity of stumpage demanded from a percent change in stumpage price. For example, .3 means that a 1% change in price would lower demand by .3%. In harvest driven runs, these numbers don't matter because the model is solving for the price that would be required to meet the requested harvest given what is happening to inventory. In a demand driven run, the demand elasticity dictates the sensitivity of harvest to price.

Supply Price Elasticities by Product for Industrial/Corporate Owners (Line 6):

```
0.3 0.4 0.5 0.3 0.5
```

The percent change in quantity of stumpage supplied from this ownership induced by a percent change in stumpage price. For example, .5 means that a 1% change in price would increase harvest by .5% other thing being equal. These numbers have a direct effect on the price required to achieve a given harvest. There must be as many entries here as there are products.

Supply Inventory Elasticities by Product for Corporate Owners (Line 7):

```
1.0 1.0 1.0 0.7 0.7
```

The percent change in quantity of stumpage supplied from this ownership induced by a percent change in product inventory. For example, 1 means that a 1% change in inventory would increase harvest by 1% other things being equal. These numbers have a direct effect on the price required to achieve a given harvest. There must be as many entries here as there are products. The .7 above for hardwoods implies that if total hardwood inventor goes up by 1%, the timber supply only goes up by .7% to reflect availability restrictions for hardwoods.

Supply Price Elasticities By Product for Non-Corporate Owners (Line 8):

```
0.3 0.4 0.5 0.5 0.5
```

This entry characterizes Non-Corporate Owners and is analogous to Line 6.

Supply Inventory Elasticities By Product for Non-Corporate Owners (Line 9):

```
1.0 1.0 0.7 0.7 0.7
```

This entry characterizes Non-Corporate Owners and is analogous to Line 7.

1.5.2 Product Definition File - *.PRD

Example File "stand5default.PRD"

```
SP PR PROD LABEL MINDBH PCTPULP WGTFACTOR
1 1 "Product1" 5 1.0 35.5
1 2 "Product2" 9 0.5
1 3 "Product3" 12 0.1
```

```
2 1 "Product1" 5 1.0 37 2 2 "Product2" 10 0.25
```

The product definition file is where the merchandizing rules are summarized. The first column is the species group. If there are 2 species groups they are assumed to be pine and hardwood. If there are 3 species groups they are assumed to be pine, soft hardwood, and hard hardwood. Within each product group, products are listed in order from smallest diameter to largest and assigned an index for the product (PR) column. In this case there are 2 pine products and 2 hardwood products. The third column gives the product label. These can be 8 characters long, but should be unique in the first 4 characters because some output files truncate this label.

Column four gives the minimum diameter at breast height (MINDBH) for the product. The standard DBH distribution file (described below) using the standard 2-inch DBH classes starting with 5 inches. In the MINDBH column you list the minimum DBH class that qualifies for this product. The PCTPULP column indicates how much of this product class should be considered pulpwood. The fifth column gives a weight conversion factor by species. All of the input data is in thousands of cubic feet (MCF). Output is multiplied by the WGTFACTOR for each species group just before it is written to the output file. The weights above convert the output units to green tons. If you entered a 1 here, output would be reported in MCF.

1.5.3 Demand Projection File - *.PRJ

The harvest projection file (.PRJ) is an optional file to describe the harvest projection by product. If in the .DAT file, the name "MPCONST.PRJ" is used as the filename for the demand projection, the model will project year zero removals by product for the entirety of the model run. The "MPCONST.PRJ" file will be created during the run. The following is an example of the contents of "MPCONST.PRJ" for the first five years of a southwide run.

```
0 2412149 853842 2448559 930257 1310979
1 2412149 853842 2448559 930257 1310979
2 2412149 853842 2448559 930257 1310979
3 2412149 853842 2448559 930257 1310979
4 2412149 853842 2448559 930257 1310979
5 2412149 853842 2448559 930257 1310979
```

The output units are in thousand cubic feet (MCF) and the product order is determined by the .PRD file. The first column is the projection year; the second is harvest of product 1 in MCF, and so forth.

Custom harvest trends, for example a 1% increase for 5 years before flattening off, can be created by importing this file into Excel and editing appropriately. Save the file with some name other than

"MPCONST.PRJ", specify this name as the harvest projection file in the .DAT file. Do NOT change line "0" since this reflects the starting point of the FIA data in the .INV file.

1.5.4 Diameter Distribution File - *.DBHtxt or *.csv

SRTS currently works with 5-year age classes. As of 2020, the new default diameter distribution file uses 1-inch delineations (e.g. "v35c_1in_dbh_gs.csv"), in contrast to a 2-inch default in previous versions. The 2-inch diameter distribution file contained the diameter distribution across the nine 2" DBH classes, starting with 5-6.9" and ending with 19+". The new 1-inch diameter distribution file represents DBH class directly with its measure in inches, beginning at 5 and ending with 28. The Product delineation file (.PRD) should adopt and reference these new 1-inch delineations. However, SRTS currently detects if the old product delineation file format is in use and accounts for this within the model.

Column	Variable	Codes
1	Station	1 = Southeast, 2 = South Central
2	Physiographic Region	1 = Coastal Plain, $2 = $ Delta,
		3 = Mountain, 4 = Piedmont
3	Owner	1 = Corporate, 2= Non-Corporate,
		3= Total Private
4	Species Group	1 = Pine, 2 = Hardwood,
		3 = Soft Hardwood, $4 = $ Hard Hardwood
5	Mgt. Type	Type $1 = Plantation$, $2 = Natural Pine$,
		3 = Mixed Pine, 4 = Upland Hardwood,
		5 = Lowland Hardwood
6	Age Class	1 = 0-5, 2 = 6-10, 3 = 11-15, 4 = 16-20,
		5 = 21-25, 6 = 26-30,, 10 = 46-50,
		11 = 50 +
7	DBH Class	5 = [5"-5.99"), 6 = [6"-6.99"),
8	Proportion of Volume in DBH Class	Continuous Number

1.5.5 Inventory File - *.INV or *.csv

The .INV file contains the starting inventory, growth, removal and acreage data for the run, summarized from FIA data. The following table identifies the variables by column for the file.

Column	Column Variable Codes/Meaning					
1	State or Basin Number	NA				
2	Sub-Region Number	Ordered by basin request				
3	Owner	1 = Corporate, 2= Non- Corporate, 3= Total Private				
4	Mgt. Type	1 = Plantation, $2 = $ Natural Pine, $3 = $ Mixed Pine,				
		4 = Upland Hardwood, 5 = Lowland Hardwood				

5	Species Group	1 = Pine, 2 = Hardwood,
		3 = Soft Hardwood, 4 = Hard Hardwood
6	Age Class	1 = 0-5, 2 = 6-10, 3 = 11-15, 4 = 16-20, 5 = 21-25,
		6 = 26-30,, 10 = 46-50, 11 = 50+
7	Growing Stock	Inventory in MCF
8	Cell GPA	Actual FIA growth/acre for the unit
		in cubic feet per acre per year
9	Regressed GPA	Smoothed growth/acre for the unit
		in cubic feet per acre per year
10	Removals	Removals in MCF
11	Land Use Removals	Removals from forestland conversion in MCF
12	Other Removals	Removals of growing stock from the commercially
		available inventory by other means (such as land
		preservation or a conservation easement)
13	Acres	NA

Making a Basin Request

Before running SRTS, a region of interest must be specified. A region, represented by a list of state and county FIPS codes, is used to construct an inventory (.INV) file. The Southern Forest Resource Assessment Consortium (SOFAC) produces .INV files based on basin requests. Model users submit a .csv file (preferred) or Excel file by email, arranged in the following manner:

	А	В	С
1	51		
2	AL-SW_S	1	3
3	AL-SW_S	1	39
4	AL-SW_S	1	53
5	AL-SW_S	1	97
6	AL-SW_S	1	129
7	AL-SW_N	1	23
8	AL-SW_N	1	25
9	AL-SW_N	1	35
10	AL-SW_N	1	91
11	AL-SW_N	1	99
12	AL-SW_N	1	119
13	AL-SW_N	1	131
14	AL-SE	1	1
15	AL-SE	1	5
16	AL-SE	1	11
17	AL-SE	1	13
18	AL-SE	1	17
19	AL-SE	1	21
20	AL-SE	1	31

The actual number of counties per basin in a basin request is typically more like twenty or more. Furthermore, the state and county lists should represent a contiguous area. For example, some users use external tools to determine which counties lie within a certain distance from a point of interest. For small basins (e.g. less than 5 counties) we recommend using "one owner" mode, since the USFS is very sensitive to disclosure of ownership data.

1.6 Modeling Options

1.6.1 DRIVER options

Default: Demand Mode

Three model driver options are available: harvest mode, demand mode, and price mode. In harvest mode, the path of removals specified in the projection (PRJ) file is followed exactly. SRTS shifts the demand curve in order to obtain the requested harvest. In demand mode the .PRJ file tells the model how far to shift the demand curve itself. The difference is illustrated in the figure below. Price mode is equivalent to the harvest mode, except the .PRJ file is interpreted as an explicit pathway of prices.

1.6.2 Biomass Options

Depending on the application, scenarios exploring the use of biomass can use built-in biomass options or simply use different .DAT files that reference a baseline custom .PRJ file and a custom .PRJ file that adds biomass to the projection.

- No Options Checked default: Demand is based only on the .PRJ file.
- **Biomass**: If this box is checked the model reads a biomass demand file. This biomass demand file has the same filename as the .DAT file but with a ".BM" extension. The format of the biomass file is:

1	"su log	ging	09.0	dat"				
2	Year	Bio	_ Demai	nd	PNI	PCT	PNUTIL	HWUTIL
3	2010	0	0	0	0			
4	2011	0	0	0	0			
5	2012	0	0	0	0			
6	2013	660	000	20	5	5		
7	2014	132	0000	20	5	5		
8	2015	132	0000	20	5	5		
9	2016	132	0000	20	5	5		
10	2017	132	0000	20	5	5		
11	2018	132	0000	20	5	5		
12	2019	132	0000	20	5	5		
13	2020	132	0000	20	5	5		

The first line of the file specifies the source of the logging residue coefficients by survey unit. This file is based on TPO removal and utilization studies adjusted for stumps. The second line is a descriptor line and is not read. For each year (column 1), a biomass demand (column 2, green tons) is specified. Column three specifies the percentage of the biomass that should come from pine feedstock. Note that "99" is interpreted as a code to use the current pulpwood harvest split between species including consideration of logging residues. A "50" in this column would imply a 50/50 split. The next two columns specify the maximum percentage of logging residues that are assumed to offset biomass demand. In this case 15% of both pine and hardwood logging residues are assumed to offset biomass demand. Biomass demand NOT offset by logging residues are assumed to add to pulpwood demand. Use of the biomass option requires use of an Excel template to compare with and without biomass demand runs including market impacts, residue utilization, displacement/leakage, etc.

- **BioBatch**: This is a custom programming option that allows whole sets of .DAT files to be run in batch mode. Contact David Rossi for details.
- **Rwd Bio Dem Split**: If this box is checked and the model is determining the species split (PNPCT=99), the model bases the split only on the roundwood species split and does not adjust the percentage based on residue availability.

1.6.3 Merch Age 10 PP

Default: On

If this box is checked then volume in the 10-15 age class are merchandized in terms of removals and inventory. This increases pulpwood volume more than removals but allow better modeling of first thinning.

1.6.4 Calibrate Growth - Calibrate GRW

Default: On

There are two growth columns in the .INV file. The CELLGPA column shows the growth per acre actually found in the FIA data. The REGGPA column shows the results of a growth regression that uses data by state, physiographic region (coastal plain, piedmont, mountain, delta), management type and owner to develop a smooth growth curve for the model to use. The figure below shows where these physiographic regions lie across the U.S. south.

FIA Survey Units in the US Southeast and Physiographic Regions

Growth calibration calculates the mean growth in pine plantations for ages 15 to 30 for both cell and regression estimates. The regression estimates are then moved up such that the mean of the

regression growth is equal to the mean of the cell growth for these ages. This calibrates the smoothed growth curve to match the levels seen in the local data. Growth calibration is implemented unless this option is turned off.

1.6.5 Oth Removals

Default: On

The .INV file now contains columns of removals, landuse removals, and other removals. Removals are harvests from land that remains in timberland, landuse removals are removals from land that does not remain in timberland, other removals are land that moves into a category where harvest is restricted (e.g. conservation easement). When this box is checked, landuse removals are added to removals in SRTS. Other removals are not considered part of removals in SRTS.

1.6.6 Dynamic Cull Factor - Dynamic Cull

Default: Off

This option creates a dynamic cull factor which allows the cull factor from product 2 to product 1 to change over time in relation to the change in price ratio. In a standard four product run, this option would increase the cull from pine sawtimber to pine pulpwood in response to pine pulpwood prices increasing relative to pine sawtimber prices.

This option requires a ".cull" file which matches the name of the DAT file. The file has six parameters in comma delimited format.

- 1. The beginning price ratio of product 2 to product 1 (e.g. sawtimber to pulp).
- 2. The maximum amount the cull factor can change in a given year. This parameter simulates gradual adjustment and prevents the model from oscillating between extremes.
- 3. The maximum cull proportion of product 2 to product 1. This number should be larger than the cull factor specified in the PRD file (which is the cull factor the model will start with), and it should be less than 1.
- 4. The minimum price ratio of product 2 to 1.
- 5. The minimum cull proportion of product 2 to 1.
- 6. The maximum price ratio of product 2 to 1.

An example format is the following. It can be copied and pasted into a text editor and saved as a ".cull" file:

```
startprcratio, maxcullchg, maxcullprp->, min-price-ratio, mincullprp->, max-price-ratio 2.0,0.08,0.4,1.5,0.1,4.0
```

The following figure shows graphically how the numbers in the cull file are related:

1.6.7 Supply Shift Factor File - *.SF

By default SRTS assumes that demand is mobile and that the market efficiently allocates demand to regions in which supply is increasing. Inventory growth in certain sub-regions may lead to increased removals in that region. If users deem this dynamic to be unreasonable based on knowledge of the region, this effect can be dampened with the supply shift factor option.

```
Product, Region, Owner, DemFctr, SupFctr

1,7,1,1,1

2,1,1,1,0.5

3,7,1,1,0.5

4,4,1,1,0.4
```

The above file dampens the supply shift of products 2-4, corporate owners in regions 1, 7, 4 in the .DAT file order. The first line should not be necessary since the default is "1"

1.6.8 Pinemap Growth ("PMAP Growth")

Default: On

Data from 20 climate models, in addition to biometric data from the PINEMAP project were incorporated into the Physiological Processes Predicting Growth 3-PG model (see Henderson et al., 2020). The model simulated growth across the historic range of southern yellow pine, growing trees for each planting year between 1971 and 2099, and ending in 2099. County level data was then supplied to us, which we aggregated to survey units and across climate models using regression techniques.

The PMAP Growth option in the latest SRTS version accesses the table of regression coefficients,

normalizes the growth to the empirical growth determined by the FIA data, and applies future growth increases in the PINEMAP growth data to the forest inventory. These growth increases vary by planting year, annual age, and FIA survey unit. Selecting this option will apply this growth forecast to the forest inventory. Users have the option of selecting either RCP4.5 or RCP8.5 in the SRTS user interface before making a run with the "PMAP Growth" option selected. RCP8.5 reflects a much larger increase in the concentration of greenhouse gases and Carbon Dioxide, whereas RCP4.5 reflects a more moderate rise in greenhouse gas concentration.

1.6.9 Dynamic Supply Elasticity - *.DE (beta)

This option was developed for work on a Southern Forest Futures project. It currently works for a four product run only and allows the user to specify a supply elasticity by year for each product.

This option requires a *.DE file of the following form:

```
A2
2016 0.07 0.18 0.19 0.42
2017 0.07 0.18 0.21 0.44
2018 0.06 0.18 0.22 0.46
2019 0.06 0.18 0.24 0.48
2020 0.05 0.18 0.25 0.50
2021 0.05 0.19 0.24 0.50
2022 0.05 0.19 0.23 0.49
2023 0.06 0.20 0.23 0.49
2024 0.06 0.21 0.22 0.48
2025 0.06 0.22 0.21 0.48
2026 0.06 0.22 0.20 0.47
2027 0.06 0.23 0.19 0.47
2028 0.07 0.24 0.19 0.46
2029 0.07 0.24 0.18 0.46
2030 0.07 0.25 0.17 0.45
2031 0.08 0.25 0.18 0.45
2032 0.08 0.25 0.19 0.45
2033 0.09 0.25 0.21 0.44
2034 0.09 0.25 0.22 0.44
2035 0.10 0.26 0.23 0.44
2036 0.11 0.26 0.24 0.44
```

1.6.10 Product Weights - *.PW

Default: Off

After solving for the equilibrium allocation of all products in a region owner, the model uses a goal program to allocate harvest across management types and age classes. The program attempts to meet the new harvest request while maintaining historical harvest patterns. If it can't meet the new harvest request, it relaxes the historical harvest pattern constraint. The goal program is set up with an equal incentive to hit all product requests. If the inventory is significantly depleted (>30%)

it will likely miss harvest requests. The harvest numbers in the .GPG file is the harvest request. If less than 95% of requested harvest is obtained in any year, region, or owner the "CHECK HVMISS FILE" is flagged. This file shows the difference between the request and actual harvest. Actual harvests as determined by the goal program can be found in the .HVMISSPCT file.

If the user wants the program to put a higher priority on meeting the request for one product, the user can change the product weights. Specifying this option requires the presence of an additional file in the model folder. This file must have the same name as the .DAT file, but with a .PW extension (e.g. "South36a.PW"). The format of this file is:

```
RG, Prod, Wgt

1 1 0.5

1 2 2.0

1 3 1

1 4 1

2 1 1

2 2 1

2 3 1

2 4 1

3 1 0.5

3 2 2.0

3 3 1

3 4 1
```

In this example, missing product 1 (based on the order in the .PRD file) in the first and third regions will be weighted by a value of 500 (25% of the weight applied to Product 2 in the first and third regions. All other products (including products 1 and 2 in the second region) will be given the default weight of 1,000. In this example, Product 2 in the first and third regions receives the highest penalty for missing the harvest request (it is given a weight of 2,000 which is 2 times that of the default weight).

Note: when SRTS is run in Harvest Mode, the harvest request is the level of demand specified in the .PRJ file. When instead SRTS is run in Demand Mode, then the harvest request is represented by the competitive equilibrium determined by the equivalence between changes in timber supply and changes in timber demand as specified in the .PRJ file.

1.6.11 Harvest Location - *.DC

Default: *On - Advanced*

This option allows the user to increase or decrease demand or harvest by product in specific regions. In contrast, by default the model moves harvest among regions and owners based on supply and demand. In order to simulate production increases or decreases in specific regions in a specific year, the economic solution - where demand is satisfied at whatever location is optimal -

must be bypassed for that year. After the model finds an optimal solution, in any year where the harvest location option applies, specified harvest in select regions are applied over and above the optimal solution. Regions not specified in the file are held constant for that year.

Specifying this option requires the presence of an additional file in the same folder as the SRTS executable ("srts_mmddyyyy.exe") is stored. This *Direct Change* file must have the same name as the .DAT file, but with a .DC extension (e.g. "South35b.DC"). The .DC file is formatted with a column for: (1) the year, (2) an index corresponding to regions based on the order of their appearance in the .DAT file (.DAT file number, not the SRTS Region I.D. number), and (3) a column for each product listing the increase or decrease in green tons. The top row is a heading row and is ignored as long no year is included. Below is an example in which:

- 1. The harvest for all four products, in the first four regions listed in the .DAT file, are changed for the year 2011.
- 2. In the year 2017, only the fourth listed region is changed, and only pine and hardwood pulpwood are affected.

```
.DC file example
2011 1 55557.97 38867.09 206053.62 -23673.57
2011 2 559926.53 117114.89 139591.76 -74643.65
2011 3 966134.74 376523.45 1049556.71 81459.11
2011 4 -88571.18 38345.73 386071.98 123139.30
2017 4 -6031.08 0 106478.36 0
```

The preceding example presents a way to adjust the starting point for the beginning of a run (assuming 2010 is the beginning) and then to bump up pulpwood demand in 2017 for the fourth listed region only. Note the first line of this file is not read by the SRTS program.

The .DC file in new versions of SRTS automatically adjusts the .PRJ file to be consistent with the .DC file contents. A custom .PRJ can be used in concert with a .DC file, but to avoid double-counting, be sure to remember that the contents of these files need to match – the total change in demand across all units in the .DC file must equate the change in demand levels specified in the .PRJ file. However, in contrast to the volumes reported in the .PRJ file, the .DC file changes are measured in Green Tons, not thousand cubic feet (MCF). The conversion factor used should match what is specified in the .PRD file (the "WGTFACTOR").

1.6.12 Partial Harvest - *.PH

This option was developed for the northern version of SRTS. It transforms harvest from an age-based classification to a stocking-based system. By management type, it specifies proportion of total forest area that is either partially harvested or clearcut. The file has the following structure:

```
Mtype PHvstProp CCutProp
1 .29 .15
```

```
2 .47 .28
4 .27 .06
5 .17 .02
6 .19 .05
7 .35 .30
8 .46 .17
```

1.6.13 Stocking Target - *.ST

SRTS allocates harvest between thinning and clearcuts based on a stocking (volume per acre) target by owner, forest type, and age class. The default stocking target is the base FIA data from the .INV file. One consequence of using starting stocking as the target is that thinning is probably underestimated in early years since most stands are near their target. Checking this option requires an auxiliary file with the same filename as the DAT file but with a ".ST" extension. The format of the file is shown below. The first line is a descriptor line followed by lines that have the owner group number, management type number, and the relative stocking target. In the file below the stocking target is set at 50% higher than the base volume per acre for corporate pine plantations, but equal to the base stocking target for other forest types.

```
OW MT ST

1 1 1.5

1 2 1

1 3 1

1 4 1

1 5 1

2 1 1

2 1 1

2 2 1

2 3 1

2 4 1

2 5 1
```

1.6.14 One Owner

The default option is to model corporate and non-corporate owners separately. Access to these data by county is restricted. Alternatively total private ownership by county is not restricted. Currently we are creating both two-owner and one-owner datasets. In this structure corporate is owner 1, non-corporate is 2, and combined is 3. If the "One Owner" button is checked SRTS runs in one owner mode and screens out anything that is not owner 3. Owner 3 is available in newer DBH distribution files so the same DBH file can be used in two types of runs.

1.6.15 Price Ceiling

Projected prices can often exceed what could realistically be expected. This is especially true in harvest mode. This option allows the user to specify a price ceiling by product. In a harvest driven run, the harvest trend follows the inventory trend after the ceiling is met. In a demand driven run, demand is assumed to be constant after the price ceiling is met. The price ceiling is expressed relative to the year 2 price.

Specifying this option requires the presence of an additional file in the model folder. This file must have the same name as the .DAT file, but with a .PC extension (e.g. "South35b.PC"). The format of this file is:

```
Price Ceiling Relative to Year 2 Price - Format - Prod, Ceiling 1 1.5
```

In this example, product 1 (based on the order in the .PRD file) will hit its price ceiling when its price increases by 50 percent.

1.6.16 Pine Plantations Only – ("PP Only")

If this option is checked then SRTS only models the pine plantation (Management Type 1) resource. All other parts of the forest base are dropped and all demand must be met from plantations.

1.6.17 Pine Sawtimber Residuals to Pulpwood - PST Resid to PPW

Default: *0.30*

This modeling option allocates a portion of pine sawmill residual chips to offset pine pulpwood roundwood demand. Valid entries are .00 to .99, but the highest value that should be entered is in the range 0.3 - 0.5. The default proportion is 0.30. If a non-zero value is entered, that proportion of pine sawtimber harvest increase is assumed to be available as sawmill residual chips to offset pine pulpwood roundwood demand. Only the increase above the initial pine sawtimber harvest is included in this calculation. Residual sawmill chips are assumed to already be fully allocated in the start year. To provide an example, entering 0.30 means that as pine sawtimber harvest increases, 30 percent of that increase is assumed to offset pine pulpwood demand.

1.7 Landuse Change Options

1.7.1 No Options Checked

The model assumes the total acres by forest type do not change over the projection. Age class distribution changes from year to year, but not total acres.

1.7.2 Endogenous Acre Change

The newest version of SRTS calculates land area shares according to updated equations originally published by Nagubadi, R., and D. Zhang. 2005. Determinants of Timberland Use by Ownership

and Forest Type in Alabama and Georgia. *Journal of Agricultural and Applied Economics* 37(1): 173-186. The new Endogenous Acre Change feature allows acreage in each time step to change based on real sawtimber prices, real hardwood sawtimber prices, agricultural rents, population, and real income per capita. To accommodate alternative macroeconomic development and climate scenarios, the Endogenous Acre Change feature can be run under 5 alternative conditions (SSP1, SS2, SSP3, SSP4, and SSP5). Each alternative scenario makes different assumptions about county level changes in population and real income per capita, leading to different rates of land use change and forest inventory.

The system of k land share equations estimated for the Endogenous Acre Change module can be written as:

$$\ln\left(\frac{y_k(t,i)}{y_1(t,i)}\right) = \beta_k' X_{it} + \epsilon_{it}$$

Where $y_k(t,u)$ is the observed share land-use for land classification k in year t and in basin i (either developed land, agricultural land pine plantation forest, natural pine forest, mixed oak/pine forest, upland hardwood forest, or lowland hardwood forest). The variable $y_1(t,i)$ represents the observed land-use share of developed land, so that the left-hand side of the above equation presents the natural log of land-use shares relative to developed land. The right-hand side factors X_{it} incorporate macroeconomic variables which characterize each SSP (such as per capita GDP growth, forestland rents, ag land rents, developed land rents and indicators which capture basin and physiographic-region variation in land-use shares). The term ϵ_{it} is an additive idiosyncratic error term, which includes measurement error from cross-equation correlation. The parameters estimated for this module are the β_k , which represent elasticities when the factors X_{it} are in log-form. Taking the exponential of the above equation yields the land use shares in each period and basin:

$$\frac{y_{ki}}{y_{1i}} = \pi_{ki} \cdot (T/A)_i^{\beta_{1k}} \cdot P_i^{\beta_{2k}} \cdot I_i^{\beta_{3k}}$$

Where: $\left(\frac{T}{A}\right)_i$ is pine rent divided by ag rents. P_i is the population. I_i is per capita GDP. These land use shares are computed from the estimated elasticities (β_{1k}) , the model-projected relative pine rents $\left(\frac{T}{A}\right)_i$, and the quantities $\pi_{ki} \cdot P_i^{\beta_{2k}} \cdot I_i^{\beta_{3k}}$ which are found in the "/lib" subfolder of the latest SRTS download. These parameters are used to compute the change in annual area of land across a basin across the k land-use classes, given the computed change in forestland rents determined by equilibrium timber prices from the market model (see Section 4 of this user guide).

1.7.3 Exogenous Acre Change - *.AC

The user specifies the acreage change by forest type in an auxiliary file. The filename must be the same as the .DAT filename with an ".AC" extension. The first line of the file is a description line which is not read. The following lines specify the region number, ownership group number, the

year of the projection, followed by the annual percentage acreage change by forest type. Note the region number in this case is based on the order in the region list, NOT the SRTS region number used to link to the DBH distribution. The first region listed is region 1, second is region 2, etc.

The .AC file in the example below has been set up for a three basin run, with no land use change assumed to occur in the third region. In the file below, forest management type 1 (pine plantations or "PP") is specified to expand in corporate plantations only in regions 1 and 2 by 5% in year 2 and by 2% in year 3. Forest management type 2 (natural pine or "NP") is specified to decline by 1% in years 2 and 3 on corporate lands in regions 1 and 2. Natural pine forests are also specified to decline by 1% in years 2 and 3 on corporate lands in region 1 but decline by 4% in years 2 and 3 on non-corporate lands in region 2.

RG	OW	YR	PP	NP	OP	UH	ВН
1	1	1	1	1	1	1	1
1	1	2	1.05	0.99	0.95	0.99	1
1	1	3	1.02	0.99	0.95	0.99	1
2	1	1	1	1	1	1	1
2	1	2	1	0.99	1	1	1
2	1	3	1	0.99	1	1	1
1	2	1	1	1	1	1	1
1	2	2	1.05	0.99	0.95	0.99	1
1	2	3	1.02	0.99	0.95	0.99	1
2	2	1	1	1	1	1	1
2	2	2	1	0.96	1	1	1
2	2	3	1	0.96	1	1	1

Note: any regions, owners, or years that are in your projection but NOT specified in your .AC file will be assumed to have no forestland use change (those buckets of acres will receive a value of 1 as in row one of the above example).

1.7.4 Exogenous Ag Price

The user specifies exogenous ag rent in an auxiliary file "lu_agprc.csv". Contact Bob Abt for details.

1.7.5 PST Only Rent

If this box is checked pine pulpwood prices are excluded from the timberland rent calculation and only pine sawtimber affects interaction with agriculture.

1.7.6 Ag = For Rent

If this box is checked ag rents are assumed to change with forest rents which dampens the forest agriculture land exchange.

1.7.7 Storm Damage ("StormDmg" - *.BH)

The Storm Damage option requires the 'Optionfile' flag in the .DAT file. SRTS will look for a .BH file (i.e. "before hurricane") in the Data Folder. The .BH file is just a .INV file that has not been altered from what the FIA data says it should be. In a hurricane simulation run, the user is "damaging" the .INV file by removing volume in some age classes. When SRTS initializes, it uses the .INV file to determine what removals by age class should look like. In StormDmg mode, SRTS reads the original .INV file and uses those empirical harvests patterns in the model run.

1.8 Output Files

1.8.1 The Main Output File - *.GPG

The main output file provides summary information about the run across basins and over time. It provides inventory at the start of each year and removals occurring in that year. Removals numbers in this files represent the competitive equilibrium level of harvests in that year. Inventory numbers in this file represent the computed inventory AFTER a goal programming problem has distributed the competitive equilibrium harvest volume across age classes, forest management types, ownership groups and basins. For example, if the .GPG file tells us that inventory of pine pulpwood (PPW) for a basin was 18 million Green Tons in year 2025 but the competitive equilibrium level of PPW removals in year 2025 was 1 million Green Tons, then the starting inventory of PPW in year 2026 should be approximately 17 million Green Tons (depending on how well the goal program was able to distribute the competitive equilibrium across age classes and forest management types).

If a WGTFACTOR was specified in the .PRD file, then removals and inventory data in this file are expressed in Green Tons. If the WGTFACTOR was set to 1.0 in the .PRD file, then inventory and removal data in this file are in MCF.

The file also computes price changes for each year of the projection $(PrcChg_t)$. An initial price for a particular product in the starting year (P_0) of the projection can be used to scale up price changes for any future year t by computing: $P_t = P_{t-1} * (1 + PrcChg_t)$.

1.8.2 Configuration Settings File (Initialization) - *.INI

1.8.3 Run Description File - *.DSC

The .DSC file is a run description file that shows all settings from a model run with the same .DAT file name. This file also shows whether the harvest miss files (*.HVMISS or *.HVMISSPCT) should be checked following the completion of the run.

1.8.4 Harvest Miss File - *.HVMISS

After solving for the equilibrium allocation of all products in a region/ownership group, the model uses a goal program to allocate harvest across forest management types and age classes. The program attempts to meet the new harvest request while maintaining historical harvest patterns. By default, the goal program is set up with an equal incentive to hit all product requests (however

these weights can be adjusted by reading in a .PW file). If the inventory is significantly depleted (>30%) it will likely miss harvest requests. The harvest in the .GPG file is the harvest request (i.e. the competitive equilibrium of removals). If less than 95% of requested harvest is obtained in any year, region, or owner the "CHECK HVMISS FILE" is flagged. This file shows the difference between the request and actual harvest. The columns of this file are Year, Region, and Owner, followed by a column for the harvest miss in tons for each product, in the same order as the PRD file.

If a WGTFACTOR was specified in the .PRD file, then removals and inventory data in this file are expressed in Green Tons.

1.8.5. Harvest Miss Percentage File - *.HVMISSPCT

The percentage difference between the harvest volume required by the market module ("REM_REQ") and the historical harvest pattern ("ADJ_REM") is found in the .HVMISSPCT file (under the variable header "REMACT/REMREQ"). When this ratio is greater than 1.0, the actual volume of removals exceeds the volume of removals requested by the market module. When this ratio is less than 1.0, the actual volume of removals falls short of the volume requested by the market module.

If a WGTFACTOR was specified in the .PRD file, then removals and inventory data in this file are expressed in Green Tons (except for the "REM_REQ" column, which is unitless).

1.8.6 Harvest Output File – "harvout.DAT"

Fractional changes in inventory, harvest and price by product (Prod Hvst), owner, region, and year.

1.8.7 Growth Adjustment File - *.GRWADJ

When the Calibrate Growth option is checked (by default), this output file reports the growth factors and adjusted growth per acre resulting from the calibration.

1.8.8 Debug File - *.DEBUG

1.8.9 DBH File - *.DBH

Reports organized in table form for growth, removals and volume by DBH class, management type, owner, region, owner, year and species.

1.8.10 DBH List File - *.DBHLST

Flat file version of the DBH file. Growth, removals and volume by DBH class, management type, owner, region, owner, year and species *before cull factors are applied according to the product specifications in the .PRD file.* Aggregate removals for a single species across all size classes and forest management types represents the *actual* level of removals as determined by the goal

programming solution (should approximate the "ADJ_REM" column from the .HVMISSPCT file when summed across all products of a certain species.

1.8.11 Rent File - *.RENT

By year, this file gives indexed pine sawtimber and pine pulpwood prices (PSWPrc and PPWPrc), their respective weights in the rent calculation (PSTWgt and PPWWgt), and indexes for timber and agricultural rent (TbrRent and AgRent).

1.8.12 Land Use File - *.LANDUSE

Gives forest and agricultural land area by region and year.

1.8.13 Age File - *.AGE

Reports organized in table form for acres, volume, growth and removals by age class for each species, year, region, owner and management type.

1.8.14 Acres by Age File - *.ACBYAG

A flat file containing volume, growth, removals and acres by age class, management type, owner, region (and region number), species and year. Data on inventory, growth, and removals are expressed in MCF.

1.8.15 Harvest Acres File - *.HVSTAC

Gives clearcut volume (ClearcutVol), thinned volume (ThinVolume(MCF)), clearcut acres (ClearcutAcres), thinned acres (ThinAcres), and total acres (TotalAcres) by region (Rg), owner (Ow), management type (MT), and age class (AgeCls).

1.8.16 Clearcut Acres File - *.CCACRE

Gives acres that have been clearcut (Age0 Acres) by region (Rg), owner, (Ow), management type (MT), and year (Year).

1.8.17 Regional Price Change File - *.RP

In a multi-region run, the model can produce a price output for each region and owner combination, showing how that sub-region alone would react to the demand shift in the .PRJ file. This might be useful to rank supply constraints in sub-regions.

The regional price produced is a spot price that does not correspond to the actual removals from the region. The actual removals from a region come from assuming that one market-clearing price clears all regional markets.

1.8.18 Dynamic Cull Factor File - *.DCF

When the dynamic cull factor option is employed, this file gives the price ratio, cull factor and maximum cull factor change by year.

1.8.19 Linear Program File - ("lpfile.txt")

A printout of the minimized model and constraints. Variable names are abstract.

1.9 OptionFile

Users can employ the OptionFile setting for advanced settings in which the user needs to make many SRTS runs and wishes to reuse input files related to Modeling Options. By default, SRTS looks for optional files with the same name as the .DAT file being run (e.g. for "South35b.DAT" SRTS looks for "South35b.DC" or "South35b.FAUST"). If the user writes the word OptionFile in the Run Description line of the .DAT file, SRTS then looks for an additional filename on the line following the SRTS Region Numbers and Region Labels line. "MyOptionFile" can be any custom name.

```
AL OptionFile
"standard5.PRD" "MPCONST.PRJ" "v34a_lin_dbh_gs.csv" "ALStack_34a_gs.inv" "AL"
6 5 2016 44 1
1 "AL-SW_S" 2 "AL-SW_N" 3 "AL-SE" 4 "AL-WCtrl" 5 "AL-NCtrl" 6 "AL-North"
"MyOptionFile"
0.3 0.3 0.3 0.3 0.3
0.3 0.4 0.5 0.3 0.5
1.0 1.0 1.0 0.7 0.7
0.3 0.4 0.5 0.5 0.5
1.0 1.0 0.7 0.7 0.7
```

2. Connected Models

2.1 Output Visualization

SRTS produces text and csv file outputs. There are a few methods for visualizing results.

2.1.1 Excel

Some example Excel templates are provided in the documentation folder. Read "outputname.GPG" into Excel, where "outputname" is given in the .DAT file before a run.

- 1. Open as a space- and comma-delimited file.
- 2. Copy these data over a pre-existing worksheet with price equations, etc.
- 3. With the new data selected, sort by RegIdx, OwnIdx, ProdIdx (hidden columns) (or columns B, D, and G in the original datafile)

2.1.2 R

A postprocessing routine that plots and maps SRTS results using R has been developed. We are releasing this script file ("Postprocessing.R") with the most recent SRTS distribution. It can be found in the Postprocessing subfolder. Installation of R is necessary to run the code, and can be downloaded from the R-project website: https://www.r-project.org/.

To use the program, first run the SRTS model with a DAT file of your choice. After installation of R (which only needs to be done once), open "Postprocessing.R". Next, find and replace in this script file all instances of the existing working directory to the working directory where your SRTS executable file and corresponding output files from the most recent run are stored. Then to run the program, press "Ctrl + A" in the script file to select all lines of the code, then hit the "Run" symbol at the top left (or type Ctrl+Enter). After running the program, the resulting figures and data will be written to your working directory or the Runs subfolder within the SRTSv35c folder.

2.1.3 Interpreting and Validating Results

It is possible to successfully run the SRTS model, yet produce output that is unexpected. Here are some rules of thumb that should be observed.

- 1. If inventory is increasing at a faster rate than removals while demand is constant, prices should go down and vice versa.
- 2. If demand is rising and removals are rising, prices may rise, and inventory increases should counteract those price increases.
- 3. Under smooth demand projections, sharp year-to-year kinks are not typical.
- 4. If error codes or the 'Check HVMISS' message are encountered, see the appropriate documentation.
- 5. Consider using some of the advanced procedures if the model behavior de_es expectations.

2.2 INVmaker

SRTS developers at North Carolina State University process inventory file requests using the INVmaker program. The INVmaker ("SRTS_INVmaker_062520.exe") executable is located in the Data folder. It looks for a *basin request file* (.csv) with three columns (typically supplied by SOFAC members). On the first row and first column, the total number of sub-regions should be designated. Sub-region labels, state FIPS code and county FIPS code should constitute the three columns in the file. The basin request for the entire south, "South35c.csv" located in the Data folder, demonstrates the appropriate format of this file for multiple-basin runs. The following is an excerpt of a basin request file, shown in Microsoft Excel.

A	Α	В	С
1	51		
2	AL-SW_S	1	3
3	AL-SW_S	1	39
4	AL-SW_S	1	53
5	AL-SW_S	1	97
6	AL-SW_S	1	129
7	AL-SW_N	1	23
8	AL-SW_N	1	25
9	AL-SW_N	1	35
10	AL-SW_N	1	91
11	AL-SW_N	1	99
12	AL-SW_N	1	119
13	AL-SW_N	1	131
14	AL-SE	1	1
15	AL-SE	1	5
16	AL-SE	1	11
17	AL-SE	1	13
18	AL-SE	1	17
19	AL-SE	1	21
20	AL-SE	1	31
21	AL-SE	1	41
22	AL-SE	1	45

2.3 Carbon & Welfare

The Carbon/Welfare post-processor uses output files from SRTS to calculate economic welfare and carbon pools implied by SRTS run results. To run the program, write the .DAT filename and Output filename in the appropriate fields, select the desired output files, and click 'Run'. To run the program for multiple SRTS runs, write the name of a batch file in the 'Batch Filename' field and instead click 'Batch'.

2.3.1 DBH by Age - *.DBHXAGE

From the Carbon/Welfare post-processor, selecting the 'DBH By AgeYr' option produces this file. It is a at file containing growth, volume, acres, removals and acres by DBH class, species, age class, management type, owner, region and year.

2.3.2 Carbon by Age - *.CARB BYAG

From the CarbonWelfare post-processor, selecting the 'Carbon Stocks' option produces this file. By year, region, owner, management type and age class, it gives acres, volume in cubic feet, volume in cubic meters per hectare, hectares, and metric tons for the following carbon pools: live tree, dead tree, understory, down and dead, forest floor and total aboveground carbon (in Megagrams or "metric tons").

YR, RG, OW, MTYPE, AgeClass, Acres, VolCuFt, m3/ha, Hectares, Livetree, Deadtree, UndStory, DDead, Floor, Total Mg

2.3.3 Welfare Analysis File - *.WELFARE

From the CarbonWelfare post-processor, selecting the 'Welfare Calcs' option produces this file. It gives producer surplus, consumer surplus, price and removals by product, owner, region and year.

2.4 SRTSassistant

This standalone executable written in Python is located in the same directory as the SRTS executable. It properly formats .DAT files and .PRD files, ensuring consistency and placing them in the appropriate location. The program automatically finds the SRTS ecoregion number that corresponds to custom basins.

The default values used by the program are found in the Data folder with a default file type. For advanced users, it is possible to manually alter these files using a text editor.

2.5 SRTSassistant (R version)

An R-based version of SRTSassistant is also available. SRTSAssistantv3.r can live anywhere. In the settings you will need to customize the paths to your SRTS directory etc.

SUtoSRTSReg.csv is needed by SRTSAssistanv3, and should be placed in the lib folder. You can overwrite the current version of that file. This file connects counties in the basin file (the file with subscript "_wSU" that is created by INVmaker) to SRTS Numbers which must be listed in the DAT file. The order of basins/sub-region in the basins file matches the order in the INV file, and the SRTS number and region are written in that order in the DAT file automatically by SRTSAssistantv3.r.

SRTSAssistant.xlsx should be placed in the main SRTS directory. It functions as a user interface. When the runs are set up here, and SRTSAssistantv3.r has correct filepaths, you can select all code in the R script and run. This will create and place all the DAT, PRD and INI files created in the appropriate directories.

This current version does not check that INV files for the run are located in the Data folder. This should be verified by the user. NOTE: Google Spreadsheets is not fully compatible with the Excel sheet (CONCAT function in particular). It must be opened in Microsoft Excel.

To use this version, open the file "SRTSassistantv3.R" in R or RStudio. Modify the directory in the following lines to your working directory, as below:

```
# Author: Jesse D. Henderson
# SRTS Assistant 2021
# Purpose: Generate input files for SRTS
# Goals:
# * compatible with HWSRTS
# * produces INI files for Monte Carlo
# * small and fast compared to python executable
library(tidyverse)
library(openxlsx)
# settings
mydir <- "E://SRTSv35c//Preprocessing//SRTS Assistant (R Version)//" # main</pre>
SRTS directory
datadir <- "E://SRTSv35c//data//" # SRTS data folder directory
libdir <- "E://SRTSv35c//lib//" # SRTS lib folder directory
makeDAT <- TRUE
makePRD <- TRUE
makeINI <- TRUE
```

In the working directory (ex: "E://SRTSv35c//Preprocessing//SRTS Assistant (R Version)//") open the file "SRTSAssistant.xlsx" and fill in parameters to characterize one or multiple runs. Then, running the file "SRTSassistantv3.R" in R will create a .DAT file, a .PRD file, and a .INI file needed to run the SRTS program based on the parameters in the accompanying excel file ("SRTSAssistant.xlsx"). For multiple runs, define parameters in a rowwise fashion, as below:

	Α	В	С	D	E	F	G	Н	1	J	K	L	М	N	0
1	DAT file p	arame	ters									Owner	0	0	0
2												Species	1	1	1
3												Product	1	2	3
4	Run	DAT	PRD	INV	DBH	GPG	basinFile	PRJ	1_Product	2_Product	startYear	projYears	0_1_1_DemPrice	0_1_2_DemPrice	0_1_3_DemPrice (
5	1	DAT1	standard6	NC	v34b_1in_dbh_gs	OUT1	NC_wSU	MPCONST	4	2	2016	2	0.308230163	0.289011085	0.315861178
6	2	DAT2	standard6	NC	v34b_1in_dbh_gs	OUT2	NC_wSU	MPCONST	4	2	2016	2	0.300127567	0.320221762	0.222190898

If multiple runs are specified in this spreadsheet, multiple .DAT files will be generated by "SRTSassistantv3.R".

3. Extended SRTS Versions

3.1 Northern SRTS

Latest Version - July 2015

Northern SRTS was developed in collaboration with researchers in New Hampshire. It sought to introduce more detail in hardwoods, primarily expressed through partial harvest functionality. This effort contained one hardwood species group category, with 8 management types reflecting more heterogeneity by species.

3.1.1 FIA Survey Units in the US Northeast

Northern SRTS was developed in collaboration with researchers in New Hampshire. It sought to introduce more detail in hardwoods, primarily expressed through partial harvest functionality. This effort contained one hardwood species group category, with 8 management types reflecting more heterogeneity by species.

3.2 Hardwood SRTS

Under Development

A Hardwood SRTS model is being developed to study developing hardwood scarcity issues outside the scope of the standard SRTS model. The following tables show the current proposed species groups, based on a 5% cut-off for species abundance (Table 3.1 and 3.2). Table 3.3 shows forest types, or management types.

Regional Extent of Hardwood SRTS Model with Unit ID Numbers

Table 3.1: Selected Species Groups for the Hardwood SRTS Study Region

SPGRPCD	SPGRP_NAME	Percent	Species Code	Species Abbrev.
2	Loblolly and shortleaf pines	9.26	1	SYP
25	Select White Oaks	9.70	2	SWO
39	Yellow-Poplar	12.11	3	POP
28	Other Red Oaks	8.37	4	ORO
32	Soft Maple	8.23	5	MAP
41	Other eastern soft hardwoods	7.35	6	OSH
27	Other White Oaks	6.77	7	OWO
29	Hickory	6.54	8	ОНН
26	Select Red Oaks	5.83	9	SRO
31	Hard Maple	4.34	8	ОНН
36	Ash	3.08	8	ОНН

990	Exotic hardwoods group	
	Maple & Birch	5
800	Maple/beech/birch group	
900	Aspen/birch group	
100	White/red/jack pine group	

Table 3.4: Age Classes the Hardwood SRTS Study Region

Age Class	Years
1	0-10 yrs.
2	11-20 yrs.
3	21-30 yrs.
4	31-40 yrs.
5	41-50 yrs.
6	51-60 yrs
7	61-70 yrs.
8	71-80 yrs.
9	81-90 yrs.
10	91-100 yrs.
11	100+ yrs.

4. Technical Documentation

4.1 Economic model

The Sub-regional Timber Supply Model (SRTS) is a short-run partial-equilibrium economic model that spatially optimizes timber harvests for a market-wide demand, subject to sub-regional supply curves that reflect price and annual inventory constraints.

The economic module in SRTS uses constant elasticity supply and demand curves. For each subregion (i), owner (o), and product (j) in one-year time steps (t), the supply function (Q^S) is a function of price (P) and total growing stock inventory (V), parameterized by a price elasticity of supply (γ) and an inventory elasticity (τ) as represented in Equation 4.1. A market-wide demand curve (Q^D) in Equation 4.2 is parameterized by a price elasticity of demand (ϵ) and an exogenous demand shifter (G). The model sums sub-regional supply curves to obtain market-wide supply and equates this with the market-wide demand (Equation 4.3).

$$Q_{iojt}^{S} = \alpha P_{jt}^{\gamma_{oj}} V_{iojt}^{\tau_{oj}}$$

$$\tag{4.1}$$

$$Q_{jt}^{D} = \beta P_{jt}^{\epsilon_{j}} G_{jt}^{\delta_{j}} \tag{4.2}$$

$$\sum_{ioj} Q_{iojt}^S = Q_{jt}^D$$

(4.3)

The model recursively solves for these market equilibria on an annual time step using a binary search algorithm. Given the region-wide market clearing price P_j^* in year t, the basin-level equilibrium harvest quantity is obtained by reading this price off the basin-level supply curve, given that basin's inventory volume $(Q_j^{S^*})$. There are as many equilibrium harvest values $(Q_j^{S^*})$ for a given year, ownership, and basin, as there are products defined in the .PRD file.

4.2. Solution approximation

SRTS must now determine how to distribute the annual (short-run) equilibrium harvest levels for each timber product across the inventory's age class distribution. To accomplish this, the partial equilibrium solutions are used to define a set of competing goals so that SRTS can compute the harvest allocation across alternative forest types and age classes. This defines a weighted linear goal programming problem.

$$\begin{split} \sum_{g=3}^{11} \sum_{m=1}^{5} c_{jgm} x_{gm} + \mu_{j} - \eta_{j} &= Q_{j}^{S^{*}} \quad \forall j = 1, ..., J \\ x_{gm} + s_{gm}^{1} - s_{gm}^{2} &= \frac{Q_{gm,t-1}^{S}}{V_{gm,t-1}} \quad \forall g = 3, ..., 11 \ \& \ \forall m = 1, ..., 5 \end{split}$$

$$\mu_j \geq 0, \eta_j \geq 0, s_{gm}^1 \geq 0, s_{gm}^2 \geq 0, x_{gm} \geq 0 + upperbounds$$

Where:

- x_{gm} : volume of removals relative to inventory in age class g, forest type m.
- c_{jgm} : volume of product j's inventory that is in in age class g, forest type m.
- μ_j , η_j : slack variables. The quantity of harvest above/below the competitive market equilibrium Q_i^* .
- s_{gm}^1, s_{gm}^2 : slack variables. The extent of removal intensity above/below last year's intensity
- W_j : "Product Weights." The relative importance of hitting the competitive market equilibrium for product j. Note: These weights can be adjusted in a .PW file.
- Z_{gm} : "Path Dependency Weights." The relative importance of harvesting the same removal intensity in age class g, forest type m as last year's removal intensity. <u>Note</u>: Users cannot currently specify these weights with an additional input file. They are set based on starting conditions observed in the .INV file (starting year FIA data).

This problem is solved for each basin, ownership group, and year of a SRTS projection. This problem is solve using a variant of the dual-simplex method. The solutions are used to draw down the available inventory within a basin, before the inventory across each age class and forest type in the basin is grown according to the regression per acre data provided in the .INV file.

4.2 Computing basin-level prices from a multi-basin run

By default, SRTS will compute market-wide annual percentage changes in roundwood prices in the .RP file. The market-clearing condition requires:

$$\alpha P_{jt}^{\gamma_j} V_{jt}^{\tau_j} = \beta P_{jt}^{\epsilon_j} G_{jt}^{\delta_j}$$

Taking the natural log of both sides:

$$\ln \alpha + \gamma_i \ln P_{it} + \tau_i \ln V_{it} = \ln \beta + \epsilon_i \ln P_{it} + \delta_i \ln G_{it}$$

Taking the first-difference of both sides (the annual change from year to year):

$$\gamma_j \Delta \ln P_{jt} + \tau_j \Delta \ln V_{jt} = \epsilon_j \Delta \ln P_{jt} + \delta_j \Delta \ln G_{jt}$$

Re-arrange to solve for price returns:

$$\Delta \ln P_{jt} = \left(\frac{\delta_j}{\gamma_j - \epsilon_j}\right) \Delta \ln G_{jt} - \left(\frac{\tau_j}{\gamma_{oj} - \epsilon_j}\right) \Delta \ln V_{jt}$$

Or as computed from the .RP file:

$$PrcChg = \left(\frac{\delta_{j}}{\gamma_{j} - \epsilon_{j}}\right) * DemChg - \left(\frac{\tau_{oj}}{\gamma_{j} - \epsilon_{j}}\right) * InvChg$$

Where: $\epsilon_i < 0$; $\gamma_i > 0$; $\tau_i > 0$; $\delta_i = 1.0$.

Note:

- $\frac{\partial \Delta \ln P_{jt}}{\partial \Delta \ln G_{jt}} = \frac{\delta_j}{\gamma_j \epsilon_j} > 0$. When demand growth is larger, roundwood price returns will be higher.
- $\frac{\partial \Delta \ln P_{jt}}{\partial \Delta \ln V_{jt}} = -\frac{\tau_j}{\gamma_j \epsilon_j} < 0$. When inventory growth is larger, roundwood price returns will be lower.

4.3 FIA Summary Procedures

The biology and initial conditions in SRTS are derived from summarized Forest Inventory and Analysis (FIA) plot data for growth, inventory and removals for each sub-region, retaining heterogeneous features of ownership (corporate, non-corporate), management type, species, age class, and diameter- at-breast-height (DBH) distributions by physiographic region.

Management type ("MT" or "MType") is defined by the following conditions of forest type codes (FORTYPCD) and stand origin codes (STDORGCD) available in the FIA data:

- 1) **Pine Plantation**: STDORGCD=1 and (FORTYPCD<500 or FORTYPCD=999). Planted stands that are a pine/softwood forest type or oak-pine forest type or nonstocked (Nonstocked is assigned to coditions that are <10% stocked so the assignment of MT relies on the forest type assigned by field crews for these plots).
- 2) **Natural Pine**: STDORGCD=0 and (FORTYPCD<400). Natural stands that are a pine/softwood forest type.
- 3) **Mixed Pine**: STDORGCD=0 and (FORTYPCD 400-409). Natural stands that are classified as oak-pine forest type.
- 4) **Upland Hardwood**: (FORTYPCD 500-599 or 800-990). Hardwood stands that are classified as oak-hickory, maple-beech-birch, and other miscellaneous hardwood types.
- 5) **Bottomland Hardwood**: (FORTYPCD 600-799). Hardwood stands that are classified as oak-gum-cypress or elm-ash-cottonwood forest types.

4.3 Merchandising Procedure

Users define products by their diameter-at-breast-height (DBH) measurement in inches in the .PRD file. DBH distributions by age class and other dimensions, contained in the DBH file, are combined with growing stock and removals information in the INV file to obtain growing stock and removals by product in each age class by species, ownership, and management type.

4.4 Advanced Options

4.5 SRTS Code

SRTS is currently written in Visual Basic. The logical structure of the model is presented below, organized by module components.

4.5.1 Main – ("srtsmmddyy.FRM")

This form file controls the design and variable inputs from the user interface.

Sub-processes:

- 1. Command1 Click()
 - Calls MakeHvstPrj()
- 2. LoadSettings Click()
 - Loads the *.ini file
- 3. Form Load()
 - Loads the setup.id file

4.5.2 GPHARV – ("gphvstmmddyy.BAS")

This module manages harvest calculations.

Sub-processes:

- 1. GPHVST()
 - Calls the goal program to minimize harvest misses by management type and age class.
- 2. MakeHvstPrj()
 - Determines removals by product implied by the .INV, .PRD and .DBH files and creates the "MPCONST.PRJ" file.
- 3. ProdVolByAC()
 - Calculates product volume by age class, merchandizing through the .DBH file.
- 4. ReadVolByDBH()
 - Reads the .DBH file.
- 5. RedimArrays()
 - Redimension arrays to save memory.
- 6. ToAnnual()
 - Annualizes removals and volume data from age class data.

• Makes growth calculations

4.5.3 Module 1 – ("frontkey.bas")

This module simply provides a license key for the linear programming solver.

4.5.4 MPMAIN – ("mpmainmmddyy.bas")

This module declares most variables in the model, simulates biology, and handles particular model behaviors related to user settings.

Sub-processes:

- 1. ConstantsAndLabels()
- 2. NewRemovals()
- 3. OutByDBH()
- 4. OutRatio()
- 5. OuttoFile()
- 6. ProdtPrint()
 - Calls OutToFile, OutByDBH
- 7. ProjectionLoop()
 - Initiates most output files:
 - i. "harvout.dat"
 - ii. *.GPG
 - iii. *.AGE
 - iv. *.ACR
 - v. *.DBH
 - vi. *.ACBYAG
 - vii. *.DEBUG
 - viii. *.DSC
 - ix. *.DBHLST
 - x. *.LANDUSE
 - xi. *.HVSTAC
 - xii. *.CCACRE
 - xiii. *.RENT
 - xiv. *.DCF
 - Calls other subproceeses:
 - i. SumAgeClass
 - ii. ProdtoPrint
 - iii. SRTS
 - iv. GPHVST
 - v. NewRemovals,
 - vi. SumPrint
- 8. ReadData()

- Reads the .INV file (var = *DataFile*)
- Creates the *.GRWADJ file
- 9. ReadSetupParams()
 - Reads the .DAT file
 - Reads Modeling options from the user interface, conditionally looking for supporting files.

10. SRTS()

- Declares variables and weights for the linear program.
- Reads in the .PRJ file.
- Sums across sub-regions to obtain total removals by owner, total removals, and total inventory.
- Calculates percent of total harvest by owner.
- Imposes market equilibrium constraints and employs an equilibrium price search loop.
- Prints the .GPG file and additional output files.
- 11. PCutLimit() deprecated(?)
- 12. Stocking()
 - Calculates volume per acre by species, region, owner, management type, age class, planting year
- 13. SumAgeClass()
 - Aggregates annual data age classes
 - Grows inventory volume by age class

14. SumPrint()

• Prints the "harvout.dat" file.

Schematic of program Procedures

4.5.5 SaFrontmip – ("safrontmip.bas")

This file declares functions and variables for the linear programming solution. References Frontmip.DLL.

4.5.6 Annual TPO adjustment coefficients for construction of a .DC file

SRTS relies on a static picture of forest inventory, growth and removals to initialize product-specific harvests in year 0 of a projection. However, this static picture is based on the average measurement date of plots surveyed in the U.S. Forest Service Forest Inventory and Analysis (FIA) program. For version 36a of the southwide U.S. FIA data, this average measurement date occurs in year 2018. To bring the forest inventory up to the current period, a method is needed to estimate the recent historical pattern of removals across sub-regions (from 2018 to the adjusted 2018 estimate, then again from 2019 through 2020). SOFAC uses a method which relies on TPO production information. Recent changes in the TPO survey towards an annual sampling strategy has allowed us to refine this methodology to compute adjustment coefficients for each year where a basin's average plot measurement dates may be.

Our method takes the TPO production data that has been aggregated to the basin level, then computes a set of coefficients for each year, sub-region, and roundwood product. These adjustment coefficients represent the annual percentage change in removals across 4 roundwood product classes: 1) small softwood, 2) large softwood, 3) small hardwood, and 4) large hardwood. Removals data in year 0 (as determined by FIA) is based on an annualized average of the removals measured from re-measured plots over the course of the latest FIA sampling cycle. Therefore, in order for our estimates of removals beyond year 0 to be commensurate with the FIA removal data, we require our TPO adjustment coefficients to be weighted according to a similar scheme. For states with a 5-year FIA cycle, the TPO adjustment coefficients in year t are computed as:

$$Small\ Roundwood:\ C_t = \frac{(Pulpwood_t + Composite_t + OtherIndustrial_t)}{W_t} - 1,$$

$$where\ W_t = (Pulpwood_t + Composite_t + OtherIndustrial_t) * \left(\frac{1}{30}\right)$$

$$* \sum_{t=0}^{t-9} \left(6 - abs\left(\frac{t + (t-9)}{2} - t\right) - 0.5\right)$$

$$Large\ Roundwood:\ C_t = \frac{(Sawlog_t + Veneer_t)}{W_t} - 1,$$

$$where\ W_t = (Sawlog_t + Veneer_t) * \left(\frac{1}{30}\right) * \sum_{t=0}^{t-9} \left(6 - abs\left(\frac{t + (t-9)}{2} - t\right) - 0.5\right)$$

These coefficients are identical for both softwood and hardwood products. For states on a 7-year cycle, the weights W_t are computed as:

$$\begin{aligned} W_t &= (Pulpwood_t + Composite_t + OtherIndustrial_t) * \left(\frac{1}{56}\right) \\ * \sum_{t}^{t-13} \left(8 - abs\left(\frac{t + (t-13)}{2} - t\right) - 0.5\right) \end{aligned}$$

and

$$W_{t} = (Sawlog_{t} + Veneer_{t}) * \left(\frac{1}{56}\right) * \sum_{t}^{t-13} \left(8 - abs\left(\frac{t + (t - 13)}{2} - t\right) - 0.5\right)$$

When a custom-defined basin straddles states with alternative FIA cycle lengths, the coefficient is computed according to whichever state contains the majority of counties within the basin. These TPO adjustment coefficients are used to build a Direct Change (.DC) file. To correctly initialize SRTS in year 1 of a projection (R_1), compute the percentage change from removals in year 0 (given by an MPCONST run) of the corresponding product type by applying the

adjustment coefficients for year 0. For example, to compute removals within a basin for year 1 of your projection, you would compute:

$$R_1 = R_0 * (1 + C_0)$$

Where R_0 is the estimate of removals given by FIA data (from an MPCONST run) for year 0 and C_0 is the adjustment coefficient for that year. For example, if the average measurement date in your basin occurs in year 2018, then year 0 removals determined from an MPCONST run represents the unadjusted 2018 removals. Year 1 removals should be the adjusted 2018 removals computed as: $R_{2018} * (1 + C_{2018})$. Then, your SRTS projection would start in year 2017, such that Year 1 of the projection removes the correct 2018 estimate of removals.

To get Year 2 removals (for year 2019 in our example), one can compute the change in unweighted TPO production from 2018 to 2019 (Δ_1). Then compute: $R_2 = R_1 * (1 + \Delta_1)$. Similarly, Year 3 removals (for year 2020 in this example), one can compute the change in unweighted TPO production from 2019 to 2020 (Δ_2). Then compute: $R_3 = R_2 * (1 + \Delta_2)$.

In the SRTS download, you can refer to the Excel-based routine for developing .DC files (found in the "/Documentation" folder) or the R-based routine (found in the "/Preprocessing" folder). Refer to Section 1.6.11 of this User Guide for more information about .DC file construction.

5. Publications (SRTS applications)

The following is a list of papers and publications which have applied the Sub-Regional Timber Supply model (SRTS).
